### Efficient Irrigation System under the Sun

The **Bauer** Pivot System 9000 is an especially efficient way of irrigation. The "Linestar" for square areas and the "Centerliner" for irregular fields are available in this series. "The requirements for material, technique and electronics are rising permanently.

Today we are irrigating land that was out of question some years ago," reports Product Manager *Johann Gallaun*. The company is counting on European quality and their striving to implement both sturdiness and user-friendliness haven proven their worth. "Plug & Play

- that's all our customers need to do unless they want to intervene in the control process," adds Gallaun. The spans between the towers contribute to increase the stability and the user-friendliness as well. The uniform arch of the span provides best stability and it adjusts perfectly to uneven terrain. Another reason for solutions from the company is the reputed high precision of control for to-the-point irrigation of different crops. Both the "Linestar" on square areas and the "Centerliner" on irregular fields can be used for to-the-point and highly efficient irrigation. The "Precision Corner System" is one of the company's flagships converting a circular irrigation surface to an almost square irrigation pattern and ensuring optimal irrigation of 98 percent of the total area available. Such efficiency is Bauer's outstanding characteristic. They also set international standards when it comes to the availability of the distributed water to the crops. ■
